AES-Crypt-PHP
=============

Yet an other PHP implementation of the open source aes crypt file format:
.aes

Use the library to encrypt/decrypt files at your site with PHP. The files
will be encrypted with 128-bit AES in CBC mode to a password of your choice.

Usage: Please see example.php

The project is a fork of IgoAtM:s code,
 originally published at:

https://forums.packetizer.com/viewtopic.php?f=72&t=403

The encrypted .aes files can be decrypted at almost any platform:
https://www.aescrypt.com/
https://www.aescrypt.com/download/

The file specification is described here:
https://www.aescrypt.com/aes_file_format.html

This library supports version 2 of the file format.

Warning
-------
Issue: Windows line endings in text files get corrupted.

Windows line breaks are substituted by Linux line breaks.
Thus the file doesn't hash the same after encryption-decryption,
and pgp-signatures are invalid.

You could avoid the problem by compressing the file before upload
to the server.
